

SITE SUPERVISION

A successful project execution requires a competent representation of the owner on the construction site. The site supervision represents the owner towards the contractor. The site supervision as a task includes the management of the construction of a structure, i.e., the coordination, arrangement, instruction and control of all activities on the construction site.

The site supervision basically takes on all suitable and expedient tasks to ensure the success of the project. In addition, the site supervision carries out the review of the construction invoicing, has the responsibility for the interdisciplinary safety on the construction site and oversees the construction logistics.

Kaiserstuhl tunnel

Sachsels tunnel

New construction of the 3rd tube
in Gubrist tunnel

Ceneri base tunnel

Our Services
